AWS Server Device ID Type Text Sound Seconds & Color

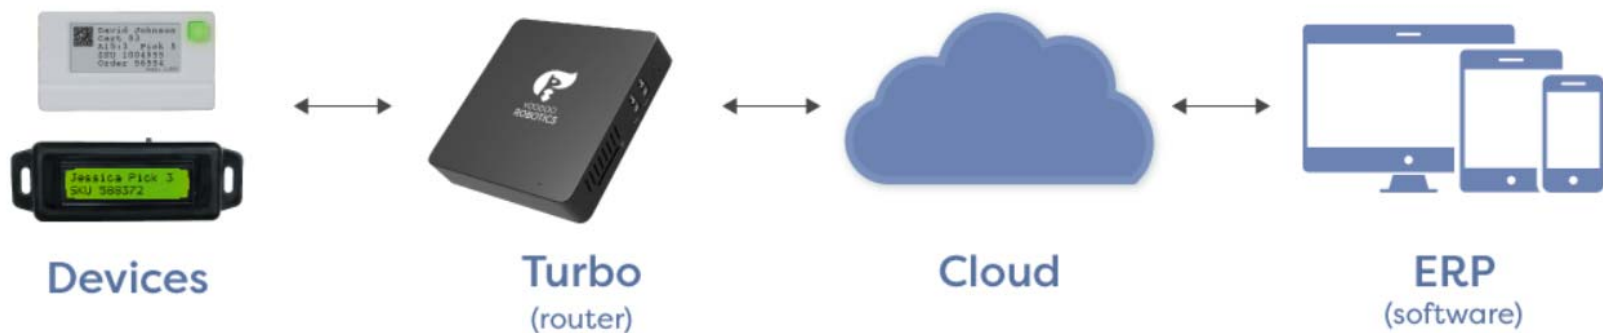

## Features

- Wireless IoT devices run on two AAA batteries
- Long battery life allows devices to last years (depending on usage)
- Five lines of custom text in the language you need
- Lights up in different colors and plays a custom tune
- Custom barcodes or QR Codes for each transaction
- Simple URL integration can even work with Excel!
- Purchase outright or month-to-month lease options available

**Just stick 'em on your shelving and hook it to the internet..... EASY!**

## More Information!

## Pick-to-Light Devices

Our Pick-to-Light System is more than a picking solution. A simple URL call causes the devices to light up in multiple colors with up to five lines of custom text. Barcodes, QR-Codes and icons are also supported. Our Pick-to-Light devices can be installed almost anywhere and easily integrate with your current ERP or WMS (or our SKU-Keeper inventory management software). The devices use Turbos to connect to the Internet. They are ideal for picking carts, flow-through racks, put walls, will-call areas and more.

## Cloud Display Devices

Wirelessly controlled through a simple URL or REST API call, the devices light up in one of six colors, and display up to five lines of custom text – for example, a pickers name, the SKU, and quantity to pick. They can even play a custom tune for each order picker.

## Turbo (router)

Install **one** or more Turbo's on the ceiling, the wall or the side of your racks to extend radio range and decrease pick-to-light response times. These devices connect pick-to-light devices to the Internet.

## ERP / WMS Software

Our Pick-to-Light technology easily integrates with your existing ERP or WMS software. You can even test it out with a starter kit and Microsoft Excel.

## Cloud

Our Pick-to-Light system uses the ultimate simple standard – a simple web URL (QueryString API). More sophisticated uses can use our REST API.

The Pick-to-Light devices easily integrate with your existing ERP or WMS. A simple request, sent to our server on the Amazon Cloud, causes the associated device to light up with up to five lines of custom text. QR Codes, barcodes and icons are also supported.
